

Frequently asked questions about Alcolin Clear

1. Do you apply Alcolin Clear on one or both sides?

One side is adequate for most applications. If the glue is drying too quickly, then a double sided application may be necessary. For difficult surfaces, application to both surfaces results in a better bond – in this specific instance, apply adhesive to one surface, then join surfaces together briefly to ensure glue transfer to the opposite surface. After about 30 seconds, join the surfaces together until the glue has dried completely.
